

**In the Claims:**

1. (Currently Amended) A method of transmitting data between a transmitter and a receiver, comprising the steps of:

transmitting, by the transmitter, a data packet onto multiple paths of a wireless network between the transmitter and the receiver, at least one of the paths including at least one repeater transceiver node;

issuing a NACK signal over the network, by the receiver, in the event that the data packet is not properly received; and

retransmitting the data packet onto the network by at least one of the repeater nodes upon receipt of the NACK signal.

2. (Previously presented) The method of claim 1 in which the retransmitting step is effected by all repeater nodes that forwarded the data packet and that receive the NACK signal.

3. (Previously presented) The method of claim 1 in which the retransmitting step is effected by at least one of the repeater nodes and the transmitter.

4. (Previously presented) The method of claim 1 in which the transmitter does not retransmit the original data packet in the event of the issuing of a NACK signal by the receiver.

5. (Previously presented) The method of claim 4 in which the transmitter does not listen

for NACK signals relating to its own transmitted data packets.

6. (Previously presented) The method of claim 1 in which the step of retransmitting the data packets onto the network by the at least one repeater node includes the step of using multiple paths available from the repeater node to the receiver.

7. (Previously presented) The method of claim 1 further including the step of the receiver issuing an ACK signal in the event that the data packet is correctly received, the at least one repeater node forwarding the ACK signal to the transmitter.

8. (Previously presented) The method of claim 1 further including the step of retransmitting the data packet, by the repeater node, after a first predetermined retransmittal interval if no ACK or NACK signal is received in respect of a forwarded data packet.

9. (Previously presented) The method of claim 8 further including the transmitter retransmitting the data packet step after a second predetermined retransmittal interval if no ACK signal is received, the second predetermined retransmittal interval being greater than the first predetermined retransmittal interval.

10. (Currently Amended) A repeater node for forwarding data packets, received from a transmitter node, to a receiver node that is the end destination of the packet, in a wireless network, comprising:

a receive module for receiving data packets originating from the transmitter;

a transmit module for forwarding the data packet to another node in the network;  
a pending packet buffer for storing forwarded data packets from the transmit  
module; and  
a retransmission module ~~means~~ for retransmitting over the network previously  
forwarded data packets for which NACK signals are received.

11. (Currently Amended) The repeater node of claim 10 further including a purge module  
~~means~~ for removing a stored data packet from the pending packet buffer when an ACK  
signal received in respect of that data packet.

12. (Currently Amended) The repeater node of claim 10 in which the retransmission  
module ~~means~~ includes a module ~~means~~ for retransmitting the data packet over all  
available paths.

13. (Previously presented) The repeater node of claim 10 adapted to forward ACK signals  
to the transmitter but not to forward NACK signals to the transmitter.

14. (Currently Amended) The repeater node of claim 10 in which the retransmission  
module ~~means~~ further includes ~~means~~ a module for retransmitting the data packet after a  
first predetermined retransmittal interval when no corresponding ACK or NACK signal is  
received.

15. (Currently Amended) A wireless network of communicating nodes including a  
transmitter, a receiver and at least one repeater for forwarding data packets, received

from ~~[[a]]~~ the transmitter node, to the receiver node that is the end destination of the packet, comprising:

a receive module in the repeater node for receiving data packets originating from the transmitter;

a transmit module in the repeater node for forwarding the data packet to another node in the network;

a pending packet buffer in the repeater node for storing forwarded data packets;  
and

retransmission module ~~means~~ in the repeater node for retransmitting, over the network, previously forwarded data packets in response to receiving ~~for which~~ NACK signals ~~are received~~.

16. (Currently Amended) The network of claim 15 in which the retransmission module ~~means~~, in the repeater node, further includes a module ~~means~~ for retransmitting the data packet after a first predetermined retransmittal interval when no corresponding ACK or NACK signal is received.

17. (Currently amended) The network of claim 16 further including second retransmission module ~~means~~, in the transmitter, for retransmitting the data packet after a second predetermined retransmittal interval longer than the first retransmittal interval, when no corresponding ACK or NACK signal is received.
